## *Camellias*

*Should never be allowed to become dry, especially during the summer when new buds are forming for the following season's bloom.*

*Plant only the same depth in the ground they were previously growing in. Make sure drainage is good as they cannot stand a soggy condition.*

## *Feeding*

*Start feeding immediately following the blooming period with at least two or three feedings about six weeks apart. An ACID food should be used, usually one containing cottonseed meal. Directions will be given on the package for amounts in application.*
